                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ŷ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene Cf fragments with the unidentified fragment. The rpoB gene fragments comparing the range of Mycobacterium species, e.g. for Cf diagnosis or to obtain epidemiological and pathogenesis information for Cf selection of appropriate therapies, including M. tuberculosis, M. leprae Cf and non-tuberculous mycobacteria (NTM) encountered in subjects infected Cf with human immunodeficiency virus (HIV). Analysis of the rpoB gene Cf ragments is rapid, precise, simple and cost effective (only 1 PCR Cf required), and can differentiate between many species in a single Cf regriment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

The present sequence for Mycobacterium tuberculosis rpoB gene (C fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from CC various Mycobacterial species. These rpoB gene fragments can be used C in the diagnosis and identification of Mycobacterium species using a CC novel PCR restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to Cc are useful to identify a wide range of Mycobacterium species, e.g. for C arguments with the unidentified fragment. The rpoB gene fragments CC are useful to identify a wide range of Mycobacterium species, e.g. for C diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC fragments is rapid, precise, simple and cost effective (only 1 PCR crequired), and can differentiate between many species in a single CC experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for CC detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 41; 50pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The present sequence for Mycobacterium terrae rpoB gene
CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO524) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC novel PCR-restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC be identified and comparing the RFLP patterns from the known rpoB gene
CC fragments with the unidentified fragment. The rpoB gene fragments
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC fragments is rapid, precise, simple and cost effective (only 1 PCR
CC required), and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual biochemical
CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
CXX

comovel por restriction fragment length polymorphism analysis (PRA) comparison the method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to CC be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for Selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC fragments is rapid, precise, simple and cost effective (only 1 PCR CC required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial smariae

The 1st several bases comprise a nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                          Mycobacterium tuberculosis potential drug target gene SEQ ID

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polynucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of
                                                                                                                                                                                                                                                                                                                                         1004

                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                               cc nucleic acids of tut, fus, atpD and/or recA genes from which probes cc and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical cc species with a combination of defined primer pairs. The method can be cused for producing probes and/or primers for detecting one or more cc used for producing probes and/or primers for detecting one or more cc parasites, for universal detection and for specific and ubiquitous cd detection and identification of an algal, archaeal, bacterial, fungal and cc detection and identification fan algal, archaeal, bacterial, fungal co detection of any bacterium, fungus or parasite and ubiquitous cd detection of any bacterium, fungus or parasite in a sample and for the cleast one toxin gene, hexa nucleic acids are used for the specific and ubiquitous detection and for identification of Streptococcus pneumoniae. Cc defection seed to design a therapeutic agent which is effective against which can be detected include Abiotrophia adlacens, Bordetella sp., cc which can be detected include Abiotrophia adlacens, Bordetella sp., cc Mycobacterium sp. Enterobacteriaceae group, Escherichia coli, cc Mycobacterium sp. Enterobacteriaceae group, Escherichia coli, cc Mycobacterium sp. Enterobacteriaceae group, Escherichia coli, cc Mycobacteriaceae family, Pseudomonads group, Escherichia coli, cc Mycobacteriaceae family prophacterium sp. Streptococcus sp. Using DNA based tests color determined in an hour and improved accuracy is also achieved.

Cc Which are given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the rpoB gene from Mycobacterium tuberculosis. Rifampin resistance is largely associated with point mutations localised in a small core region of 81 base pairs in the rpoB gene, which encodes the RNA polymerase beta subunit. To detect a mutation, a complex is formed comprising a first sequence representing the predetermined region of the gene of the organism and a second sequence representing the corresponding region of the gene of the wild type organism in double stranded form. Each member of at least one pair of non-complementary strands within the complex has a label. The association of the labels in the complex is related to the presence of the mutation. The presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI;

                                                                                                                                                                                                                                                                                                                                                             This invention relates to a method for detecting drug resistance in a strain of an organism. The method comprises detecting the presence of a least 1 mutation in a first sequence and relating the presence of the mutation to drug resistance. Included in the invention are a kit for carrying out the method and a method for detecting the presence of a difference between two related nucleic acid sequences in an organism. The methods are useful for detecting resistance to drugs such rifampin and pyrazinamide in Mycobacterium. The present sequence represents the Mycobacterium tuberculosis rpoB gene (which encodes the RNA polymerase beta subunit). The sequence is used in an example of the method of the invention for the detection of rifampin resistance in M. tuberculosis.

The present sequence for Mycobacterium ulcerans rpoB gene
CC fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC movel PCR restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC diagnosis and comparing the RFLP patterns from the known rpoB gene
CC fragments with the unidentified fragment. The rpoB gene fragments
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC required), and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual biochemical
CC detecting specific Mycobacterial species
                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                     The present sequence for Mycobacterium gordonae type III rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for selection of appropriate therapies, including M. tuberculosis, M. leprae
                                                                                                                                                                                                                                                                             and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                    The present sequence for Mycobacterium marinum rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a covel PCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) CC mplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene CC fragments with the unidentified fragment. The rpoB gene fragments comparing the RFLP patterns from the known rpoB gene CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR crequired), and can differentiate between many species in a single cappending those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for CX detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁

The present sequence for Mycobacterium avium rpoB gene
C fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the known rpoB gene
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC are useful to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected
CC fragments is rapid, precise, simple and cost effective (only 1 PCR
CC experiment, including those difficult to distinguish by usual blochemical
CC tests. Also described are oligonuclectide probes (AASO5227-AASO5242) for

The present sequence for Mycobacterium gordonae type I rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC method. The method comprises obtaining a restriction fragment length cC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene CC fragments with the unidentified fragment. The rpoB gene fragments comparing the RFLP patterns from the known rpoB gene CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC fragments is rapid, precise, simple and cost effective (only 1 pCR CC experiment, including those difficult to distinguish by usual biochemical CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 14
